TITLE: Electronic pulse ferrotransistor devices in numerically-
controlled machine tools

PERIODICAL: Stanki i instrument, no. 4, 1961, 3-9

TEXT: This article deals with investigations conducted at ENIMS on the possibility of using ferrite cores in numerically-controlled machine tools. The operating principle of ferrite elements and various arrangements are described, and recommendations are given as to the selection of basic parameters such as numbers of winding turns, load impedance, etc. A ferrotransistor cell is shown in a photograph, and its circuit which is used for different control system combinations (Fig. 3), is described in detail. Its ferrite functions as a memory unit, and the triode as a pulse amplifier. The output pulse cannot be shorter than 1.5-2.0 μ sec and may be prolonged to 3.5-4.5 μ sec, by using more turns in the basic winding. The following numerical control system units with such ferrotransistors are described and illustrated in circuit diagrams: a binary frequency divider; a dual-input coincidence circuit; a rectifier; collector circuits with two and with one

Electronic pulse ferrotransistor...

ferrotransistor; a permissive circuit; a dynamic valve as a memory cell; a delay circuit; a decade code divider; a synchronizing circuit for matching signals received from pickups or from the program with timing pulses. Two circuit diagrams illustrate two types of ferrotransistor cells developed by ENIMS, which are now serially produced in the Soviet industry. Ferrotransistorized circuits have been preliminarily tested and stated to be considerably more dependable than the existing tube and semiconductor circuits. No special selection is needed to match transistors with ferrites, and this facilitates the adjustments. ENIMS has by now completed some ferrotransistorized arrangements and used them for an ЛКП-0ИФ (LKP-OIF) code converter and a 6М42ПМ (6M42PM) machine tool. Some previously developed numerical control systems will be replaced by them. There are 17 figures and 5 Soviet references.

TITLE: Electronic pulse devices in numerically controlled machine tools

PERIODICAL: Stanki i instrument, no.3, 1961, 1-5

TEXT: A description is given of elements and component units of numerical machine-tool-control systems, developed during recent years at the electro-technical department of ENIMS and built around electron tubes, transistors and ferrites. They have been used for control systems of 6H13PP (6N13PR) and 6M42P (6M42P) milling machines, 1K62P (1K62P) and MA-12 (MA-12) lathes, an ЛКП-01-Ф (LKP-01-F) code converter for recording a program on magnetic tape and other devices. The design and operation of the devices are described in detail and illustrated with diagrams. The units have passed prolonged laboratory tests. The following units are described: (1) a one-stage tube pulse amplifier, the simplest elementary unit around which all the other units can be built. It is also widely used as an independent amplifier for pulse voltage, current, or power, and can either

Card 1/2

Electronic pulse devices

S/121/61/000/003/001/006
D040/D112

preserve or change the pulse shape on its output; (2) a binary counting cell trigger with two tube triodes and either two separate or one common input. The trigger counts up to 2; if more pulses have to be counted several series-connected cells are used. It can also be used as a frequency divider and has a neon tube that helps in tuning and fault finding; (3) a pulse shaper (single flip-flop oscillator), which can also be used as a temporary pulse delay element; (4) a coincidence circuit and a connection circuit with germanium or silicon rectifiers as diodes, or with electron tubes instead; (5) a one-stage transistor amplifier with grounded emitter; (6) a transistor trigger (two-stage d.c. amplifier) with strong feedback; (7) a transistor single flip-flop oscillator; (8) transistorized coincidence and connection circuits; (9) switching output amplifiers. A control system with electron tubes in the trigger circuits and linear transistors for all the other elements was successfully used by ENIMS in a code converter, though such systems are comparatively complex and are not quite so reliable due to the need for special matching arrangements. There are 15 figures.

AUTHOR: MAYDIS, V.A., ROZINOV, A.G., ROZMAN, Ya.B. PA - 3611
TITLE: Electric Drive of Machine Tool Feed with Magnetic- and Semiconductor
Amplifiers. (Elektroprivody podachi stankov s magnitnymi i polupro-
vodnikovymi usilitelyami, Russian)
PERIODICAL: Stanki i Instrument, 1957, Vol 28, Nr 6, pp 7 - 10 (U.S.S.R.)
ABSTRACT: In the drives of machine tool feeds electric direct current motors
are at present frequently used the revolutions of which can be reduc-
ed to 1 : 50 and more of the normal number by a change of amperage
by means of a transformer. However, a rotating transformer is very
expensive, takes up much room, and causes a considerable amount of
notice. These disadvantages are particularly marked in the case
of machines of medium size where the main drive is effected by means
of alternating current and the transformer is the only one used.
A simple and reliable electric drive is obtained by means of a direct
current motor with a magnetic amplifier, a type which is being
used with great success in the U.S.S.R. and in other countries.
It costs about half as much, it is more simple and has no rotating
parts. The development of the production of semiconductor triodes
and the increase of their efficiency up to 10 - 30 W make it
possible to use them with success in connection with magnetic
amplifiers within the system of controllable electric devices.
The testing of such an electric drive on the test bench is de-

Card 1/2

Electric Drive of Machine Tool Feed with Magnetic- and
Semiconductor Amplifiers. PA - 3611

scribed (with illustrations). In the conclusion, the possibility
of making wide use of this new drive in the electric circuits
of the electric feed of metalworking machines is discussed.

TITLE: The Performance of Cantilever Rams in Bending Steel Sheets
(Rabota konsol'nykh puansonov pri gibke listov stali)
PERIODICAL: Vestnik Mashinostroyeniya, 1958, Nr 5,
pp 51 - 54 (USSR):

ABSTRACT: A centrally-supported, two-wing cantilever ram of welded construction, 900 mm long and 255 mm deep, in the centre, with a flat bottom and sloping top is illustrated in Figure 1. Rams of this type were tested for deformation under load by compressing soft copper plates placed at different positions. The deformations at 50, 100 and 150 tons are shown in Figure 2. The distribution of load for the same total load is shown in Figure 4 and the calculated stresses in Figure 5. An analysis of the ram structure is carried out under certain assumptions about load distribution. The analysis yields the required maximum cross-section which does not greatly depend on the assumptions made. These tests and analysis form the basis for designing cantilever rams in sheet-bending machines.

PURPOSE: This publication is intended for hydrologists, hydrochemists, and hydrometeorologists.

COVERAGE: This is a collection of 22 articles on the hydrochemistry of rivers and water bodies in the USSR. The authors discuss pollution, spectrographic methods of determining the content of microelements in water, and the content and discharge of ions, gases, as well as chemical, biogenic, and organic substances. A map showing the distribution of the ionic discharge of rivers in the USSR is the most complete to appear in print to date. No personalities are mentioned. Each article is accompanied by references.

The synthesis of (naphthylmethyl)novolac S. N. Chakravarty and R. M. Bhatnagar. *J. Applied Chem.* (C.S.S.R.) 12, 211 (1940). The novolac prepd by boiling for 4 hrs. 10 mols of phenol with 5 mols of formaldehyde in the presence of 0.1% HCl (by wt. of phenol), by the wt. (Rast) 390, hydroxyl no. 15.7% and softening point (Cremer-Sarnov) 57°. It was converted to the Na deriv. and condensed with α -C₁₀H₇CH₂Cl, prepd. by the Blanc method (C. A. 17, 1630) by the condensation of C₁₀H₇, HCHO and HCl (gas) in the presence of ZnCl₂. The (naphthylmethyl)novolac (yield 200% by wt. of novolac) was sol. in C₁₀H₈ and its homologs, ab. C₁₁H₈ and fused oil; softening point was 20.5° higher than that of novolac. In all expts. the degree of substitution of hydroxyl H varied from 71 to 92%. A. A. Podgorny condensation of reaction.

Thermal Extinction of Fluorescence in a Solution of Biacene
Byull. Pol'skoy Akad. Nauk, Otd. III, Vol 1, No 1-2, 1953, pp 53-56

Investigated the effects of temperature on the intensity of fluorescence of a solution of biacene ($C_{24}H_{16}$) in silicone. Assumes that the nonradiational desactivation of the molecule approaches the internal conversion of the energy from electron excitation. The potential curves for the two stable configurations of the biacene molecule were examined and it was proposed that the potential curve corresponding to the excited state of the beta form crosses the potential curve of the basic alpha form at a point where ΔE is greater than the normal fluctuation level of the excited state of the beta form. After surmounting the potential barrier, ΔE leads to an extinction in fluorescence and the beta form converts to the alpha form. The energy source for this transition is the thermal movement of the molecules in solution. (RZhKhim, no 21, 1954)

1962, 188-190 ✓

TEXT: Recently, the insulator plants tested new high-resistance
ceramic materials for making high-voltage insulators. KM-1 (KM-1) material
was found having the best mechanical properties. The zavod "Proletariy"
("Proletariy" Plant) produced insulators made of KM-1, designed for 500-kv
air circuit breakers. The insulators were tested under 90 and 80 kg/cm²
experimental pressure. The Leningrad Branch of GIEKI produced a new "No-133"
material which replaces high-voltage porcelain and is able to resist high
mechanical loads. No-133 contains 18% alumina to replace former porcelain
shards and the quartz content. Industrial testings have shown that the

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 9, 1965, 49

TOPIC TAGS: vacuum pump, pressure, suction, lubricant

ABSTRACT: This Author Certificate presents a rotary vacuum pump consisting of a cylindrical case with end covers, an eccentrically positioned rotor with plates, a suction nipple mounted on the cylindrical surface of the case, and pressure nipples (see Fig. 1. on the Enclosure). To distribute the lubricant uniformly along the length of the plates by changing the direction of motion of the gases being exhausted in the case, the pressure nipples are mounted in the end covers of the case. Orig. art. has: 1 figure.

Title : The (, p) Reaction on Cobalt

Orig Pub : Ceskosl. casop. fys., 1957, 7, No 5, 499-504

Abstract : The author has measured the energy and angle distributions of photoprotons obtained by irradiating cobalt with gamma quanta from the Li (p, γ) reaction ($E_{\gamma} = 17.5$ and 14.8 Mev). The energy distribution is evidence that all protons are originated by evaporation and not by direct nuclear photoeffect. Nevertheless the angle distribution is not quite isotropic and does not satisfy a single of the known relations. Also measured was the energy of the reaction of formation of Fe^{58} , which equals 0.74 ± 0.16 Mev, and the energies of its excited states: 6.75, 6.44, 5.90, 5.47, 4.98, 4.35, 3.50, and 3.20 Mev.

¹ The (γ, p) reaction on cadmium and tin. ²¹ M. Rozkoš, ²¹
²¹ M. Smrčka, and ²¹ O. Jakubček (Karlova Univ., Prague).
~~Czechoslov. J. Phys. 10, No. 2, 125-32, 1960 (in Russian).~~
 The nuclear photoeffect is studied on Sn and Cd; in contrast
 to most of the expts. with this effect up to now, discrete γ -
 rays were used. The exptl. arrangement of a previous
 paper (CA 53, 18870e) was used. Results of interest in-
 clude the discreteness of the energy spectrum and the un-
 conventional form of the angular distribution. With Sn,
 the top proton shell of which is completely occupied, the
 shape of the energy spectrum corresponds to the Wilkinson
 theory (CA 52, 9804f) of giant resonance; with Cd, the
 energy spectrum is similar to the evapn. spectrum. The
 angular distributions of the photoprotons of both elements
 do not satisfy the commonly used relations corresponding to
 existing theories of the nuclear photoeffect. They can,
 however, be described quite well by empirical equations
 which contain assoc. Legendre polynomials; the results
 have features of both a direct and a collective process. A
 satisfactory explanation of the results would require a new
 theory including both types of processes. A. Krehmeller.
